The invention relates to a nucleic acid comprising single nucleotide polymorphisms (SNPs) associated with diseases. The nucleic acids comprising the SNPs and probes and primers for detecting them may be used in assays for the diagnosis of diseases associated with SNPs (such as sickle cell anaemia, agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolaemia, polycystic kidney disease, hereditary spherocytosis, Von Willebrand's disease, tuberous sclerosis, hereditary haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, and acute intermittent porphyria, symptoms of, or susceptibility to, multifactorial diseases of which a

Diagnosing neurodegenerative disorder in an individual by evaluating ratio of D3 dopamine receptor mRNA and/or alpha7 nicotinic acetylcho receptor mRNA of test individual, to control gene mRNA of healthy acetylcholine

Example 2; Page 8; 33pp; English.

The invention relates to a method of diagnosing a mental disorder or a neurodegenerative disorder that involves measuring mRNA of D3 dopamine receptor and/or alpha7 nicotinic acetylcholine receptor (alpha7 AChR), and of a control gene in peripheral blood lymphocytes (PBLs) of an individual and of at least one healthy control individual, calculating the ratio between D3 dopamine receptor mRNA and the control gene mRNA and/or the ratio between alpha7 AChR mRNA and the control gene mRNA for each individual, evaluating the ratios obtained for the tested individual and the healthy control individual. An increase in D3 dopamine receptor mRNA and/or decrease in alpha7 AChR mRNA in the tested individual in comparison to the control individual indicates that the tested individual for the tested individual individual

CC The invention describes an isolated polypeptide segment (I) whose genes CC are fat regulated. (I) or the polypucleotide encoding it (II) are useful CC for diagnosing the presence of or a predisposition for a disorder CC involving fatty acid regulated genes in a subject. A composition CC containing (I) or (II) is useful for treating a disorder involving fatty CC acid regulated genes, where the disorder is selected from a CC containing (I) or (II) is useful for treating a disorder involving fatty CC acid regulated fatty acid (PUPA) disorder is selected from a CC disorder (such as hypertriglyceridaemia, dyslipidaemia, atherosclerosis, CC coronary artery disease, cerebrovascular disease or peripheral vascular CC disease), inflammation (such as sinusitis, asthma, pancreatitis, CC osteoarthritis, rheumatoid arthritis or acne), body weight disorders (CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disord
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 1601
ABK13568/c
diagnosis of micro-metastases, autoimmune lesions and renal failure in biopsy specimens, plasma samples and body fluids. The antibody may be used to modulate enzyme activity in a disease, such as metastasis of malignant cells, tumour anglogenesis, inflammation, chronic obstructive pulmonary disease (COPD), atherosclerosis, neurodegenerative disease (e.g. prion protein amyloid plaques of Genstmann-Straussler Syndrome, Creutzfeldt-Jakob disease, Scraple) or infection, particularly viral infection. The human prostasin-like serine protease gene provides a therapeutic target of decreasing human prostasin-like serine protease activity, in particular for treating or preventing metastatic cancer. The agonists and antagonists of the nucleotide sequence may be used to mimic, augment and inhibit the enzyme activity which may be useful to treat osteoporosis, Paget's disease and degradation of bone implants protease activity inhibits both smooth muscle cell proliferation and lipid accumulation and inhibit the progression of restenosis and atherosclerosis. The nucleic acid sequence is also useful in diagnostic
                                                                                                                                                                                                                                                                                                                                                                            This invention comprises the cDNA and protein sequences of an isolated prostasin-like serine protease and reagents and methods for regulating the human prostasin-like enzyme activity Prostasin is a tryppin-like serine protease purified from human seminal fluid. An antibody specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel

                                  Hunicola lanuginosa, the AMG terminator and the full length Aspergillus nidulans pyrG gene. This construct was used in a method of producing a polypeptide, which involves cultivating a fungal host cell in a medium and isolating the polypeptide from the medium. The host cell comprises a first sequence encoding the polypeptide in tandem with a sequence comprising a crippled translational initiator sequence operably linked to a gene encoding a selectable marker in which the 3' end of the crippled translational initiator comprises a T at the -3 position and a T at one or more of the -1, -2 and -4 positions, and the copy number of the first nucleic acid sequence is increased by culturing the host cell under conditions that select for multiple copies of the selectable marker. The method is useful for producing a polypeptide selectable marker. The method is useful for producing a polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                constructing SVI-based expression/transduction vectors and as antisense oligonucleotides or for construction of antisense SVI vectors. Antisense SVI polynucleotides block expression of SVI proteins and/or SVI viral replication in SVI infected cells, and thus are useful for treating SVI infections. SVI polypeptides are useful in vaccines for preventing SVI infection and for treating SVI infection. (Updated on 06-AUG-2003 to
                                                                                                                                                                                                                                                                                                                                                                                    Producing a polypeptide such as an enzyme, comprises cultivating a fungal host cell containing a sequence encoding the polypeptide in tandem with another sequence comprising a crippled translational initiator sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                 The invention relates to polymorphic nucleic acid sequences encoding the very low density lipoprotein receptor (VLDLr) and methods of analysing nucleic acid sample for polymorphisms. This method comprises obtaining nucleic acid sample from one or more individuals, and determining the nucleotide occupying one or more of the polymorphic sites of one or more nucleic acid molecules. The method is useful for predicting the presence absence or severity of a particular phenotype or disorder (e.g. cardiovascular disease such as coronary heart disease associated with a particular genotype. The nucleic acids containing the polymorphic sites may also be useful in forensics and paternity testing. Wild-type or variant vLDLr gene products can be used in the diagnosis and treatment of cardiovascular diseases and other diseases associated with VLDLr. The
                                                                                                                                                                                                                                                                                   Polymorphic nucleic acid sequences encoding the very low density lipoprotein receptor, useful for predicting the presence, absence or severity of a particular phenotype or disorder, e.g. cardiovascular disease such as coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               10-SEP-1999;

22-AUG-2001
PCR primers AAH25543-44 were used to assay for sentinel virus I (SVI). The primers and SVI polynucleotides are useful for detecting SVI virus. Probes and primers derived from SVI polynucleotide sequences are useful for identifying and isolating new variants of SVI. SVI polynucleotides are useful for detecting SVI virus, producing SVI polypeptides,
                                                                                            Novel virus, designated sentinel virus I, associated with nonA-G hepatitis, and polynucleotides and polypeptides of for detecting SVI virus and/or SVI virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to the presence of genetic polymorphisms associated with inflammatory disease and correlating their occurrence with disease states. They used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                            WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                       Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 21 BP; 5 A; 7 C; 7 G; 2 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 2001-226749/23.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids comprising single nucleotide polymorphisms, useful applications such as forensics, paternity testing, medicine, gene analysis and phenotype correlations to diseases such as diabetes
                                                                                                                                                                      polymorphism; vascular disease; coronary artery myocardial infarction; atherosclerosis; stroke; pulmonary embolism; paternity test; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel polypeptides, termed MBSPX and polynucleotides encoding the MBSPX polypeptides. The MBSPX polypeptide, nucleic acid and an MBSPX antibody are useful for treating or preventing a pathology associated with the protein especially in humans. The MBSPX nucleic acid can be used to express MBSPX protein (e.g. via a recombinant expression vector in a host cell in gene therapy applications), an to detect MBSPX mRNA in a biological sample or a genetic lesion in a MBSPX gene. Disorders associated with insufficient or excessive production of MBSPX protein include cancer, preclampsia, immune system disorders and inflammation, neurological disorders, cardiovascular disorders; and skin and muscle abnormalities. The anti-MBSPX antibodies can be used to detect and isolate MBSPX proteins and modulate MBSPX activity. Sequences AAF83026-033 represent gene specific PCR primers for amplifying the MBSP6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   13-OCT-1999;

polynucleotides encoding the MBSPX polypeptides. The MBSPX polypeptide, nucleic acid and an MBSPX antibody are useful for treating or preventing a pathology associated with the protein especially in humans. The MBSPX nucleic acid can be used to express MBSPX protein (e.g. via a recombinant expression vector in a host cell in gene therapy applications), an to detect MBSPX mRNA in a biological sample or a genetic lesion in a MBSPX gene. Disorders associated with insufficient or excessive production of MBSPX protein include cancer, preclampsia, immune system disorders and inflammation, neurological disorders, cardiovascular disorders; and skin and muscle abnormalities. The anti-MBSPX antibodies can be used to detect and isolate MBSPX proteins and modulate MBSPX activity. Sequences AAP83026-033 represent gene specific PCR primers for amplifying the MBSP6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             13-OCT-1999;

fragment produced by a process comprising culturing a transformed Aspergillus fungal cell containing a recombinant plasmid. The lactoferrin can be used in a variety of products including human or animal foods, as therapeutic additives to enhance iron transport and delivery, and for the virucidal and bacteriocidal qualities, as additives for eye drops, contact lens and other eye care solutions, topical skin care products, ear drops, mouthwashes, chewing gum and toothpaste. The bactericidal lactoferrin polypeptides are useful as preservatives in the above products, and as therapeutic anti-infection agents. Each protein may also
                                                                                                                                                                                                                      Lactoferrin or its fragment, produced by culturing Aspergillus cell transformed with vector comprising endogenous gene whose product is secreted, and endogenous proteolytic enzyme-identified linker seque:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  be used as a nutrition supplement and as a source of amino acids metals. The present sequence represents a mutagenic oligonucleot: human lactoferrin, which is used in an example from the present:
                                   The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide array is useful for gencyping a nucleic acid sample at one or more loci via single base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphis present sequence is one such polymorphic locus used in the present invention. The amplified nucleic acid product is then used as a template in a SBE reaction with an excension primer. The SBE reaction products are used to form the oligonucleotide array. Note: This sequence includes a SNP represented by the degenerate codon in the
                                                                                                                                                                                                                            Universal array of oligonucleotides tags attached along with locus-specific tagged oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligonucleotide array; genotyping; polymorphic locus; single nucleotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAC73616 standard;
                                                                                                                                                                                       Example 7; Page 62; 70pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic marker of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the

                                                                                                                                             Improving cholesterol levels in individuals with hypercholesteremia or diabetes involves identifying genetic markers such as glucose transpor and myostatin gene that positively correlate with cholesterol levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         substitution in the insulin receptor substrate-1 (IRS-1) gene. DNA was taken from men with diabetes or at risk of developing diabetes. The subjects underwent 9 months of endurance exercise training and their improvement in diabetes status was quantified. A number of gene loci were analysed and certain genotypes and/or alleles were found to positively analysed.

AAZ65579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID Nos 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not accually given a sequence in the Sequence Listing from the

                                                                                                                                                                      invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.                                                                                                                                                 This sequence represents a PCR primer which used in the sequencing of the CC DNA encoding cytochrome P450. The PCR product is used in a method for CC determining the ability of cells to metabolise a drug. The method CC comprises using a detection primer complementary to a sequence 5' in CC relation to a point mutation of single-stranded DNA encoding a cytochrome P450 isoform, and detecting the hybridisation. Cytochrome P450 is a group CC enzymes located in the endoplasmic reticulum primarily in the liver. CC cytochrome P450 (CYP) is involved in the major route of phase I drug CC metabolism. The polymorphism of these enzymes results in the appearance of different phenotypes with differential capacities to metabolise drugs. The method allows for the detection of a mutation in a CYP nucleotide CC metabolise a drug. The method is useful for measuring a patient's ability to metabolise a drug, specifically drugs which are metabolised by CC cytochrome P450 such as omeprazole, pentaprazole, phenytoin, verapamil, CC propanolol, tolbutamide, S-warfarin, tricyclic antidepressants such as

AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical officacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. N.B. The SBQ ID NOs 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the

                This sequence represents a PCR primer for the KanMx4 gene. The invention relates to a method for the production of ethanol by growing respiration-deficient yeast (A) in which at least one nuclear gene (I), or its product, required for respiration is non-functional and/or inhibited. The method is specifically used to produce fuel alcohol, but may also be used to produce beverages. (A) are less sensitive to the Pasteur effect (reduction in ethanol yield in presence of oxygen) than normal strains but have comparable ethanol tolerance (better than that of strains with non-functional mitochondrial genes). They thus provide more rapid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a PCR primer for the KanMx4 gene. The invention relates to a method for the production of ethanol by growing respiration-deficient yeast (A) in which at least on enuclear gene (I), or its product, required for respiration is non-functional and/or inhibited. The method is specifically used to produce fuel alcohol, but may also be used to produce beverages. (A) are less sensitive to the Pasteur effect (reduction in ethanol yield in presence of oxygen) than normal strains but have comparable ethanol tolerance (better than that of strains with non-functional mitochondrial genes). They thus provide more rapid production of ethanol and higher yields than known respiration-defective strains, and they can not metabolise ethanol as a secondary source of carbon, allowing higher final ethanol concentrations to be reached and eliminating the need for a rapid arrest of cell culture. Also maintenance of strictly anaerobic conditions is not necessary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 21 BP; 6 A; 6 C; 3 G; 6 T; 0 U; 0 Other;

                                            This invention describes a novel method for obtaining a set of biallelic markers represented in AAXS2533.X52632 and AAXS2833.X52843 for use in constructing a high density equilibrium map of the human genome. The method involves (a) obtaining a nucleic acid library comprising genomic DNA fragments comprising the full genome or a portion (b) determining the corder of genomic DNA fragments in the genomic DNA fragments and (d) sequence of selected regions of the genomic DNA fragments and (d) identifying nucleotides in the genomic DNA fragments and (d) identifying nucleotides in the genomic DNA fragments which vary between individuals, thereby defining a set of biallelic markers. The methods can be used for identifying traits such as disease (e.g. Alzheimer's disease), drug response, drug efficacy and drug toxicity. They can be used for selecting an individual for inclusion in a clinical trial. The method is used to map the position of genes in a genome (preferably the human genome). The sequences described in AAXS2833.X52832 and AAX52844-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Also maintenance of strictly anaerobic conditions is not necessary
                                                                                                                                                                                                                                                                                                                                            Production of biallelic markers - by obtaining a genomic DNA library determining the order and sequence of DNA fragments and identifying nucleotides which vary between individuals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                drug toxicity; primer; ss.

                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                            CC The recombinant expression plasmid vector comprises a promoter and control of an endogenous secreted Aspergillus polypeptide, an amino-terminal portion of an endogenous secreted Aspergillus polypeptide, an amino-terminal portion of an endogenous secreted Aspergillus polypeptide, an expression of a LF or its fragment of the vector permits of the expression of a LF or its fragment as a fusion protein and the used for the recombinant production as a processed protein. The vectors can be used for cells. The human gene can be transferred to mammalian systems such as cows and other agriculturally important animals and expressed in milk. The incorporation of a LF gene and expression in the milk of animals can combat an iron deficiency typical in piglets. The inclusion of a LF gene can be used in piglets. The inclusion of a LF gene with expression should improve an animal's disease resistance to combat an iron deficiency typical in piglets. The inclusion of a LF gene combinant LF can be used in a variety of product such and volude a production device for the secreted protein for therapeutic use. The combinant LF can be used in a variety of products including human or ce animal foods, as therapeutic additives to enhance iron transport and ce productions, topical skin care products, contact lens and other eye care solutions, topical skin care products, eardrops, mouthwashes, chewing gum ce and toothpaste. The bactericidal LF polypeptides are also useful as contact lens and other eye care ce solutions and therapeutic uses, and as bacteriostats and bacteriodes. Ce and protein may also be used as a nutrition supplement and as a source of amino acids and metals. The vector allows commercial quantities of LF isolated from milk e.g. lactoperoxidase and lysozyme. The present ce includes are also useful as a cource of solutions to the kex2 cleavage site and hLF start site by in vitro cuttor.

The method results in the a highly sensitive, simple and rapid determination of RNA without fear of error in pipetting or contamination. AAX23927-X23961 are PCR primers used in the method of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          primers 1 and 2 (AAV32917) were used in a PCR reaction to amplify the the 3' end sequence of the Aspergillus niger beta-galactosidase genomic DNA. The PCR product was used in the method of the invention. The invention provides a synthetic beta-galactosidase which differs from the natural occurring enzyme in being inactive in milk but capable of being activated by a chemical or condition naturally present in the gasrointestinal tract of humans. The design of this synthetic enzyme comprises of a tail domain fused to the beta-galactosidase through a cleavage site. The presence of the tail domain renders the enzyme inactive and it can also be used as a purification handle. The synthetic beta-galactosidase is claimed to be able to hydrolyse lactose in vivo to overcome lactase intolerance and the contraction of the synthetic beta-galactosidase intolerance and the contraction of the synthetic beta-galactosidase intolerance and the contraction of the synthetic beta-galactosidase intolerance and the contraction of the contraction of the contraction of the contraction of the synthetic beta-galactosidase intolerance and the contraction of the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            thereby reduce associated gastrointestinal disorders. The synthetic betagalactosidase is also claimed to be useful in cheese making whereby it is activated by chymosin when added to milk
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAV21601
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Synthetic beta-galactosidase inactive in milk but active in vivo - can be chemically activated and used to treat lactose intolerance, also useful

Patched protein other than Drosophila for characterising the phenotype of a tumour melanogaster patched protein used

Disclosure; Page 42; 86pp; English

cc a transcriptional termination region, both functional in an expression consective as an extrachromosomal element or integrated into the genome of the cell can be predisposed to develop basal cell carreinoma as a result control of the transfection. By analysing DNA, functional analysis of patched control of the transfection. By analysing DNA, functional analysis of patched control of the transfection. By analysing DNA, functional analysis of patched control of the transfection of the transfection and the predisposition to developmental abnormalities and control of cancer can be diagnosed. This analysis can also be used for characterising the phenotype of a tumour, particularly a carcinoma, control of the phenotype of a tumour, particularly a carcinoma, control of the phenotype of a tumour, particularly a carcinoma, control of the phenotype of a tumour, particularly a carcinoma, control of the patched gene in oncogenesis. Signal transduction, etc. Transgenic animal control of the skin. The patched gene in oncogenesis, signal transduction, etc. Transgenic animal control of the skin. The patched gene in of human or mouse core can be used to identify ligands or substrates that bind to, modulate, or control of patched gene. These agents could be used as tumour cannot call adherent partners (e.g., in wound hashing and ageing). Sequence 21 BP; 5 A; 3 C; 7 G; 6 T; 0 U; 0 Other; of at least 12 nucleotides in length, as other than an intact chromosome under transcriptional control of a transcriptional initiation region, and protein other than a Drosophila melanogaster patched protein, gene. This is used for determining the intronic boundaries of the various exons of human ptc. The invention provides a method for the construction of a paragraph of an expression of the invention provides a method for the construction of an expression of the invention of an expression of the invention of the construction of the human patched (ptc) and the construction of an expression cassette comprising a nucleic acid encoding a patched cell adhesion promoters (e.g. 'n wound healing and 유 ageing) fragment

                                                                                                                                                                                                          for polynucleotides encoding DNA polymerases from Kaposi's sarcoma herper virus (KSHV). The oligonucleotide may be used for detecting viral DNA or RNA in a sample of primate origin, especially in the diagnosis of herpes viral infection. Herpes virus DNA polymerases of this invention, may be used in vaccines for the protection against infection by a herpes virus of the RFHV/KSHV family. They may also be used in the design and screening of anti-viral drugs. Antibodies raised against the polymerase or fragments of it, may be used in the detection of herpes virus

                                                                                                                                                                                                                                                                                                                                                                               This invention relates to novel oligonucleotide PCR primers which may used to identify markers associated with genetic diseases and traits i dogs, in particular to diagnose genetic diseases that are not phenotypically visible and to identify carriers of recessive diseases. specific application is diagnosis of copper toxicosis (CT). The invent can also be used to create a genetic map of the canine genome; to generate breed-specific profiles; to establish paternity and to identi dogs from DNA fingerprints. The method provides rapid analysis of the target sequences from only a small sample of DNA. Diagnosis can be don at any time in the dog's life. The present sequence is that of a PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New oligonucleotide primers for diagnosis of genetic diseases and in dogs - amplify specific regions of the genome containing microsatellite repeats, especially for diagnosing copper toxicosis
                                                                                                      Aspergillus niger beta-galactosidase genomic

The capture and detection probes are able to hybridise to non-overlapping segments of the target sequence. See also AAQ20389-Q20420 and
The probe is one of a set of nine probes having a sequence complementary to the upstream and downstream conserved region of a region encoding four Chlamydia variable surface proteins. The probes are used as primers to amplify Chlamydia DNA contg. a serotype specific base sequence, by PCR, and then used to identify positive PCR prods. The method allows accurate diagnosis of microorganisms of the Chlamydia genus. See also AAQ33000-7. (Updated on 10-MAR-2003 to add missing OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cros

                                    The present sequence represents a sequence tagged site (STS) primer used coin the isolation of cosmids from the DPC4 (deleted in pancreatic cancer, CC locus 4) region, and gene identification. DPC4 is a tumour suppressor CC gene. Detection of truncated DPC4 protein, or of homozygous deletions or intragenic mutations in the nucleic acid encoding it, is used to diagnose CC (in vivo or in vitro) proliferative diseases, especially pancreatic CC carcinoma, bile duct, bladder or colorectal cancer. Crohn's disease, CC colitis-associated meplasia or chronic ulcerative colitis. These CC conditions, where associated with a homozygous deletion, can be treated by administering an agent that: (a) modulates DPC4 expression, CC specifically a sense DPC4 sequence (particularly in the form of a vector, i.e. by gene therapy), but also an antisense sequence where DPC4 protein compared as hybridisation probes for detecting presence of thuman chromosome 18q21.1 fragments. When a homozygous deletion is CC detected in this region, an agent can be administered that accumulates CC within, or kills, only cells which contain such a deletion. This agent CC exploits the absence of an enzyme (or other protein) encoded by a CC gelocrive acrive and lost by the deletion, i.e. it has a highly

MYH14 is associated CC with brain, peripheral nerves, ovary and intestines and has closest CC homology with the myosin family proteins MYH0, MYH10 and MHC11. The CC product of the invention is used to identify mutations and alteration in cc chromosomal 19q region with the rat sequence AF139055 (encoding a non-cc chromosomal 19q region with the rat sequence AF139055 (encoding a non-cc chromosomal 19q region with the rat sequence AF139055 (encoding a non-cc chromosomal 19q region with the rat sequence AF139055 (encoding a non-cc chromosomal 19q region with the rat sequence af139055 (encoding a non-cc suscie myosin heavy chain B) indicated a potential human homologue. A set of exonic primers was designed and used to amplify cDNA derived from mRNA cl isolated from the sciatic nerve. The 1 amplicons were sequenced and casembled to form an approximately 6kb sequence that included an open reading frame for MYH14, but lacked the polyadenylation signal. The corresponding gene contains 40 exons (about 100 kb), entirely present corresponding gene contains 40 exons (about 100 kb), entirely present within the bacterial artificial chromosomes AC020906, AC010515 and CC AC008655. The MYH14 protein corresponds to the hypothetical protein FLJ 1381. This sequence represents a PCR primer used to amplify the human CC MYH14 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 1570
AAQ20630
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a new compound (e.g. an antisense CC oligonucleotide), having a sequence comprising 8-80 by targeted to a nucleic acid encoding DRAKZ (death-associated protein kinase-related epoptosis-inducing protein kinase 2, also known as serine/threonine CC kinase 17B, STK17B), specifically hybridises with the nucleic acid encoding DRAKZ (appearing as App8859 and representing bases 58695-149492 of human chromosome 2) and inhibits expression of DRAKZ. Also included are inhibiting the expression of DRAKZ in cells or tissues, screening for a modulator of DRAKZ, a diagnostic method for identifying a disease CC a modulator of DRAKZ, a diagnostic method for identifying a disease state, a kit or assay device comprising the compound and treating an animal having a disease or condition associated with DRAKZ. The cligonucleotide compound is useful for preparing a composition for treating hyperproliferative disorders, degenerative disorders, cancer, autoimmune disorders, Parkinson's disease, Parkinson's disease, blood cell disorders, cancer, autoimmune disorders and viral infection. The present company and an antisease of convented in the present concentral and an antisease of convented the argeting DRAKZ.
                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'.0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human Angiopoietin-2 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents an antisense oligonucleotide targeted to DNA encoding a human Angiopoieti polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    encoding the human Angiopoietin-2 polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage
                                                                                                        Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             disorder, e.g., cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New oligonucleotide compound that inhibits expression of Angiopoietin-2, useful for preparing a composition for treating hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             11-DEC-2002; 2002US-00317803
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                11-DEC-2002; 2002US-00317803
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a compound targeted to a nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 15; SEQ ID NO 86; 102pp; English

                                                                                                                                                                                                      The invention relates to a compound targeted to a nucleic acid molecule encoding Huntingtin interacting protein in [HIP-1] protein interactor. The compound is useful for treating an animal having a disease or condition associated with HIP-1 protein interactor, such as dysregulation of apoptosis. The compound may also be used for diagnostics, therapeutics, prophylaxis and as research agents and kits, or to elucidate the function of particular genes or to distinguish between functions of various members of a biological pathway. The present sequence represents a human HIP-1 antisense oligonucleotide target sequence.
                                                                                                                                                                                                                                                                                                                             New compounds targeted to a nucleic acid molecule encoding HIP-1 protein interactor, useful for treating an animal having a disease or condition associated with HIP-1 protein interactor, such as dysregulation of

The present invention is directed to antisense oligonucleotides targeted to sentrin-2 (also known as SMT3H2, SMT3A and SUMO-3) and which modulate the expression of sentrin-2. The invention is useful for preparing a composition for treating hyperproliferative disorder such as cancer. The invention acts as a cytostatic agent. The invention is also useful in gene therapy. The present sequence is human sentrin-2 antisense oligonucleotide. This sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       useful for preparing a composition for treating disorder, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New oligonucleotide compound that inhibits expression of sentrin-2, useful for preparing a composition for treating hyperproliferative
                                                                                 ADP82103 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a compound targeted to a nucleic acid molecule encoding Huntingin interacting protein i (HIP-1) protein interactor. The compound is useful for treating an animal having a disease or condition associated with HIP-1 protein interactor, such as dysregulation of apoptosis. The compound may also be used for diagnostics, therapeutics, prophylaxis and as research agents and kits; or to elucidate the function of particular genes or to distinguish between functions of various members of a biological pathway. The present sequence represents a human HIP-1 anticense of iconstants.

The compound is useful for treating an animal having a disease or condition associated with HIP-1 protein interactor, such as dysregulation of apoptosis. The compound may also be used for diagnostics, therapeutics, prophylaxis and as research agents and kits, or to elucidate the function of particular genes or to distinguish between functions of various members of a biological pathway. The present sequence represents a human HIP-1 antisense oligonucleotide target sequence.

The compound is useful for treating an animal having a disease interactor associated with HIP-1 protein interactor, such as dysregulation of apoptosis. The compound may also be used for diagnostics, therapeutics, prophylaxis and as research agents and kits; or to elucidate the functic
                                                                                                                                                                                                                       New compounds targeted to a nucleic acid molecule encoding HIP-1 protein interactor, useful for treating an animal having a disease or condition associated with HIP-1 protein interactor, such as dysregulation of
                                         of particular genes or to distinguish between functions of various members of a biological pathway. The present sequence represents a

In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. The present sequence represents a human glucose transporter-4 antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cytostatic; antisense therapy; cytokine-inducible kinase; cytokine-inducible kinase inhibitor; antisense technology; cytokine-inducible kinase expression; hyperproliferative disorder; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to antisense oligonucleotides targeted to a nucle acid molecule encoding Glucose transporter-4. The oligonucleotides specifically hybridise with the nucleic acid molecule encoding Glucose transporter-4 and inhibit the expression of Glucose transporter-4. The antisense oligonucleotide is useful for inhibiting the expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense oligonucleotides for modulating Glucose transporter-4 expression, useful for diagnosing, preventing or treating conditions associated with the transporter's expression e.g. hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADN30100 standard; DNA;

```
cc cytokine-inducible kinase; a diagnostic method for identifying a disease cc state, comprising identifying the presence of Cytokine-inducible kinase in a diagnostic method for identifying a disease cc state, comprising at least one of the primers or probe comprising the method for identifying a disease cc in a sample using at least one of the primers or probe comprising the method in the specification; a kit or assay conclected esquences as mentioned in the specification; a kit or assay conclected comprising the above compound; and a method of treating an animal cc having a disease or condition associated with Cytokine-inducible kinase, comprising administering to the animal a therapeutic or prophylactic camount of the compound so that expression of Cytokine-inducible kinase is continibited. The antisense oligonucleotide is useful for inhibiting the cexpression of Cytokine-inducible kinase in cells or tissues to prevent or treat disease associated with the kinase expression, such as the prophylaxis, or as research reagents or kits. This sequence corporates a human cytokine-inducible kinase antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding Cytokine-inducible kinase. The compound specifically hybridises with the nucleic acid molecule encoding Cytokine-inducible kinase (which comprises a sequence of 2169 bp fully defined in the specification) and inhibits the expression of Cytokine-inducible kinase. Also described are: a method of inhibiting the expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cytokine-inducible kinase, comprising contacting a preferred target segment of the nucleic acid encoding Cytokine-inducible kinase with one or more candidate modulators of Cytokine-inducible kinase, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytokine-inducible kinase in cells or tissues, comprising contacting the cells or tissues with the new compound so that the expression of Cytokine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides useful for modulating Cytokine-inducible kinase expression, useful for diagnosing, preventing or treating conditions associated with aberrant kinase expression e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 15; SEQ ID NO 86; 56pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     transporter-4 and inhibit the expression of Glucose transporter-4. The antisense oligonucleotide is useful for inhibiting the expression of Glucose transporter-4 in cells or tissues to prevent or treat diseases associated with their expression, such as a hyperproliferative disorder. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. The present sequence represents a human glucose transporter-4 antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ward

                                                                                                                                                                                                                                                                                      The invention relates to compounds, compositions and methods for modulating the expression of mitogen-activated protein kinase kinase kinase kinase la (also called MAPSK11, mixed-lineage protein kinase 3, MIK-3, SH3-containing proline-rich protein kinase, SPRK). The composition comprise antisense oligonuclectides targeted to MAP3K11. The compound and the methods are useful in treating an animal having a disease or condition involving dysregulation of cellular apoptosis. The invention is also useful in gene therapy. The present sequence is an antisense oligonuclectide targeted to human MAP3K11 DNA. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    New compound that modulates mitogen-activated protein kinase kinase kinase 11 expression, useful in treating an animal having a disease condition involving dysregulation of cellular apoptosis.

The composition comprise antisense oligonucleotides targeted to MAP3XII. The compound and the methods are useful in treating an animal having a disease or condition involving dysregulation of cellular apoptosis. The invention is also useful in gene therapy. The present sequence is human MAP3XII DNA target site. This sequence is used to illustrate the method of the

The method comprises: (a) aligning a first primer and a second primer; and (b) selecting the first primer where the first primer at its 3' end does not contain four or more bases that are perfectly matching to the 3' end sequence of the first primer or a second primer, the first primer at its 3' end does not contain seven or more bases that are perfectly matching except one mismatch to the 3' end sequence of the first primer or the second primer, the first primer at its 3' end does not contain six or more bases that are perfectly matching to a sequence anywhere of the first primer or the second primer, and the first primer at its 3' end does not contain eleven or more bases that are perfectly matching except one mismatch to a sequence anywhere of the first primer or the second primer, and the first primer or the second primer. The method is useful for designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase chain reaction. It is also useful in the identification of multiple genes related to multifactorial diseases, the genome-scale detection of genetic alterations, the studies in pharmacogenetic reactions, the genotyping technologies. This sequence corresponds to an example of a primer of the invention.
                                                                                                                                                                                                                                                                    Query Match

Identifying a compound that induces senescence in a mammalian cell, useful for treating abnormal cell proliferation, comprises assaying expression of a cellular gene in the cell in the presence and in that absence of a compound. assaying and in the

Example 2; SEQ ID NO 19; 29pp; English.

The invention describes a method of identifying a compound that induces CC senescence in a mammalian cell. The method comprises: culturing the mammalian cell in the presence and absence of the compound; assaying CC expression of at least one cellular gene selected from 73 genes given in CC the specification, in the cell in the presence and in the absence of the compound; and identifying compounds that induce senescence when CC compound; and identifying compounds that induce senescence when CC expression of at least one of the cellular gene is higher in the presence of the compound than in the absence of the compound. Also described are: a compound that induces senescence in a mammalian cell identified from the method above; assessing efficacy of a treatment of a disease or condition relating to abnormal cell proliferation or neoplastic cell compounds that induce senescence associated induction of cellular gene expression. Compounds that induce senescence in abnormally proliferating or neoplastic cells are useful for treating a complastic cell growth. This sequence represents a reverse transcriptase or condition relating to abnormal cell proliferation or neoplastic cells are used to identify genes induced and reverse transcriptase or condition relating sequence represents a reverse following accompound that induces senescence induced and reverse transcriptase conventions and the described are senescence and represent set of the cells. doxorubicin-induced sensescence of HCT 116 cells.

                                                                                                                                                                                                                                                                                        5
                                                                                                                                                                                                                                                                                                                                                                                 Codon, coding region, 5 or 3 intron-exon junction, intron or region CC with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target C chosen from a gene encoding interleukin (II)-4 receptor, interleukin (II) C7 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CCC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to come or more nucleic acid target(s) or expressed product(s), for the CC prevention and/or treatment of a respiratory or lung disease. The CC oligonucleotides are useful for reducing or inhibiting expression of a CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are CC useful for preventing or treating a respiratory or lung disease. The CC espiratory or lung disease is associated with hyper-responsiveness to CC and/or increased levels of, adenosine and/or levels of adenosine A CC receptor(s), and/or asthma and/or long allergies associated with CC is chosen from airway inflammation. allergy, asthma, impeded respiration.

CC relates to a method for analysing a biomolecule in a biological sample, CC comprising altering SAC1 activity in the sample and measuring the CC activity, a method for analysing a polynucleotide in a biological sample, CC comprising contacting a polynucleotide in a biological sample, CC comprising contacting a polynucleotide in a biological sample with a CC probe where the probe hybridises to a SAC1 polynucleotide to form a CC probe where the probe hybridises to a SAC1 polynucleotide to form a CC probe where the probe hybridises to a SAC1 polynucleotide to form a CC of identifying susceptibility to obesity or diabetes comprising comparing the nucleotide sequence of the suspected SAC1 allele with a wild type CC and the wild-type sequence identifies a sequence variation of the SAC1 nucleotide sequence, and a method of treating or preventing obesity, CC diabetes or alcoholism associated with expression of SAC1, comprising CC administering to a subject a pharmaceutical composition and a transgenic cCC animal that carries an altered SAC1 allele. The methods and compositions CC of the invention are useful for screening drugs for inhibition or consumption therapies and for identifying sweeteners and alcohols. This sequence represents a PCR primer used to amplify murine SAC1 DNA of the

The oligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A receptor(s), and/or asthma and/or lung allergies associated with a receptor(s), and/or asthma and/or lung allergies associated with inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or the contractive pulmonary obstruction of the contractive pulmonary obstruction of the contractive pulmonary obstruction or the contractive pulmonary obs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; impeded respiration; cystic fibro; chronic obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; airway obstruction; bronchoconst:

CC chosen from a gene encoding interleukin (II)-4 receptor, interleukin (II)-6 component from a gene encoding interleukin (II)-7 receptor, cCR1, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, DDE4 C or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to come or more nucleic acid target(s) or expressed product(s), for the CC prevention and/or treatment of a respiratory or lung disease. The CC oligonucleotides are useful for reducing or inhibiting expression of a CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are CC useful for preventing or treating a respiratory or lung disease. The CC respiratory or lung disease is associated with hyper-responsiveness to CC and/or increased levels of, adenosine and/or levels of adenosine A CC receptor(s), and/or asthma and/or lung allergies associated with cCC inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, CC cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SEQ ID NO 2447; 174pp; English

The invention relates to oligonucleotides anti-sense to an initiation CC codon, coding region, 5' or 3' intron-exon junction, intron or region CC with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target CC chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 E, PDE4 C or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to come or more nucleic acid target(s) or expressed product(s), for the CC prevention and/or treatment of a respiratory or lung disease. The CC prevention and/or treatment of a respiratory or lung disease of a cc gene or manA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The creptor(s), and/or asthma and/or lung allergies associated with hyper-responsiveness to c inflammation or an inflammatory disease. The respiratory or lung disease to a schosen from airway inflammation, allergy, asthma, impeded respiration, CC is chosen from airway inflammation, bronchitis, armay obstruction pulmonary disease (COPD), chronic obstructive pulmonary of the pulmonary of the contractor of the contra
       bronchoconstriction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 2;

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (II)-4 receptor, interleukin (II)-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; 88; interleukin-4 receptor; IL-4; interleukin-5 receptor; IL-9 (CRI; CCR3; Eotaxin-1; RANTES; MCP4; CD23; ICAM; CCAM; tryptase a; tryptase b; PDE4 A; PDE4 B; PDE4 C; PDE4 D; respiratory disease; lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; impeded respiration; cystic fibrosis; chronic obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; airway obstruction; bronchoconstriction
                                                                                                                                                                                                                                                                                                           Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2004-293804/27.

                                                                                                                                                                                                                                                                                                              also known as HDAC-A. The composition comprises antisense compounds that can be targeted towards HDAC4. The antisense oligonucleotide is useful for inhibiting the expression of HDAC4 in cells or tissues. It is also useful for treating an animal having a disease or condition associated with HDAC4, such as a hyperproliferative disorder, particularly cancer i.e. myeloid leukaemial. The compound is used for diagnostics, prophylaxis, or as research reagents or kits. It is also useful in antisense therapy. The present sequence is an antisense oligonucleotide targeted towards human HDAC4 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens.

The antisense oligonucleotide is useful for modulating the expression of Histone deacetylase 4 in cells or tissues. It is also useful for treating humans having a disease or condition associated with Histone deacetylase 4, such as cancer, infection or inflammation. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a human histone deacetylase 4 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        length targeted to a nucleic acid molecule encoding human Histone deacetylase 4 (which comprises a sequence of 8459 bp fully defined in the specification). The compound specifically hybridizes with and inhibits the expression of human Histone deacetylase 4. Also described are: a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotides for modulating human Histone deacetylase 4 expression, useful for diagnosing, preventing or treating diseases associated with Histone deacetylase 4, e.g. cancer, infection or
